FAST

INTRODUCTION

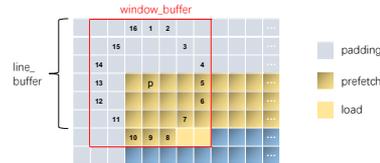

FAST (Features from accelerated segment test) is a **corner point detection method**, which can be used to extract feature points and complete tracking and mapping objects. It is faster than other well-known feature point extraction methods such as SIFT, SUSAN, Harris. FAST corner detection method is very suitable for real-time video processing.

Corner point detection method

Global dataflow scenario

Read_block and cycle processing

CREATIVE DESIGN

Use **#PRAGMA HLS DATAFLOW** to automate global function pipeline, means read the pixel value of the latter point while calculating. Using **on-chip cache and prefetch** to optimize **read_block module** outputting one data per cycle. Implement FIFO with **hls::stream** to keep data synchronized between multiple function modules. Each **7*7 convolution block** is packed into one piece of data in the FIFO.

Algorithm	CPU latency	FPGA latency

RESULTS

Betweenness

INTRODUCTION

In graph theory, Betweenness Centrality is one of the measures of network graph centrality based on the shortest path. For a fully connected network diagram, any two nodes have at least one shortest path. The shortest path in an unweighted network diagram is the sum of the number of edges the path contains. The medial centrality of each node is the number of times these shortest paths pass through that node.

Betweenness Centrality in graph theory

```

Algorithm 1: BC
Require: undirected graph G=(V,E) with |V|=n, |E|=m
Ensure: Trans[|V|][|V|]
1: sumset Trans[0][0]
2: for i in [0:n-1] do
3:   sumset Trans[i][i]
4:   sumset Trans[i][i]

CREATIVE DESIGN

The global algorithm can be divided into 2 main parts, BFS (Breadth First Search) module and ComputeB (Compute Betweenness Centrality) module, which could depend on latency of one cycle. Try to reduce latency by such methods: (1) Array splitting is used to increase read and write ports to achieve parallel processing (2) Reduction of pre-read data (3)Ensure that the pipeline input data interval is 1.

Algorithm	CPU latency	FPGA latency
